

Column control without spreadsheet risk

Purpose-built lifecycle management for analytical columns in pharma API QC laboratories.

Audit-ready

Role-controlled

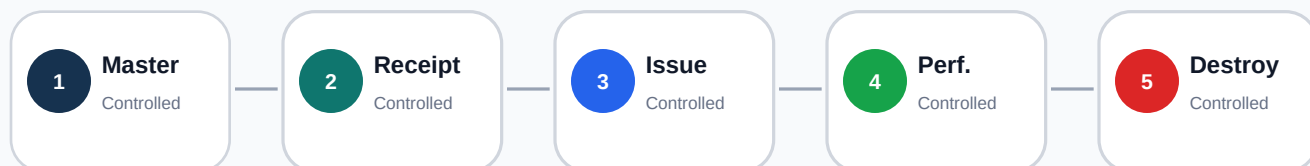

Workflow-led

What it replaces

Disconnected spreadsheets, manual review trackers, informal role control, and scattered attachment evidence.

What it creates

One controlled lifecycle across masters, receipts, issuance, performance, destruction, reviews, and audit trail.

Structured, simple, and credible for a demo with QC, QA, and IT stakeholders.

Designed for real laboratory operations

The application keeps entry simple for analysts while preserving control points for reviewers, managers, and administrators.

User administration

Create users, assign roles during creation, and capture the action in audit trail.

Dynamic masters

Define column masters, dimensions, units, and performance parameters as needed.

Workflow review

Route master activation, receipt acceptance, performance failures, and destruction approvals.

Attachment evidence

Attach files with server-side validation and checksum metadata.

Audit visibility

Show who did what, when, against which record, with a reason where applicable.

Demo-ready scope

Focused on the column lifecycle without heavyweight LIMS complexity.

Positioning

Column Management helps QC laboratories make analytical column control easier to run, easier to review, and easier to defend.
